Understanding these concepts is essential for designing systems with high performance, robustness, and efficiency, particularly in applications such as wireless communications, radar, sonar, and digital data transmission.

Introduction to Detection, Estimation, and Modulation Theory

Detection, estimation, and modulation are interconnected disciplines that facilitate effective information transfer over various channels. They address challenges such as noise interference, signal degradation, and bandwidth limitations, enabling systems to operate reliably under diverse conditions.

What Is Detection Theory?

Detection theory involves developing methods to determine the presence or absence of a signal in a noisy environment. This is crucial in scenarios like radar detection, wireless communication, and sensor networks, where signals are often weak and contaminated by noise.

Key objectives of detection theory include:

- Minimizing false alarms (detecting a signal when none exists)
- Minimizing missed detections (failing to detect an existing signal)
- Balancing the trade-offs between these two types of errors

What Is Estimation Theory?

Estimation theory focuses on deriving the most accurate possible estimates of unknown parameters of a signal or system based on observed data. These parameters could include amplitude, phase, frequency, or timing.

Main goals of estimation theory:

- Achieve unbiased and efficient estimates
- Minimize estimation error variance
- Provide confidence intervals for estimated parameters

What Is Modulation Theory?

Modulation theory deals with the process of encoding information onto carrier signals by varying their properties such as amplitude, frequency, or phase. This allows digital or analog data to be transmitted efficiently over communication channels.

Types of modulation include:

- Amplitude Modulation (AM)
- Frequency Modulation (FM)

Likelihood Ratio Test (LRT)

The likelihood ratio test is a statistical method used in detection to decide whether a signal is present. It compares the likelihoods of the observed data under two hypotheses:

Mathematically:

$$
\Lambda(x) = \frac{L(x|H_1)}{L(x|H_0)}
$$
